DossierMind

A shared document brain for clients and accountants

Document context before accounting

Live prototype with server-side AMD inference

AMD Developer Hackathon: ACT III

The work before accounting

Documents arrive. The context still needs to be rebuilt.

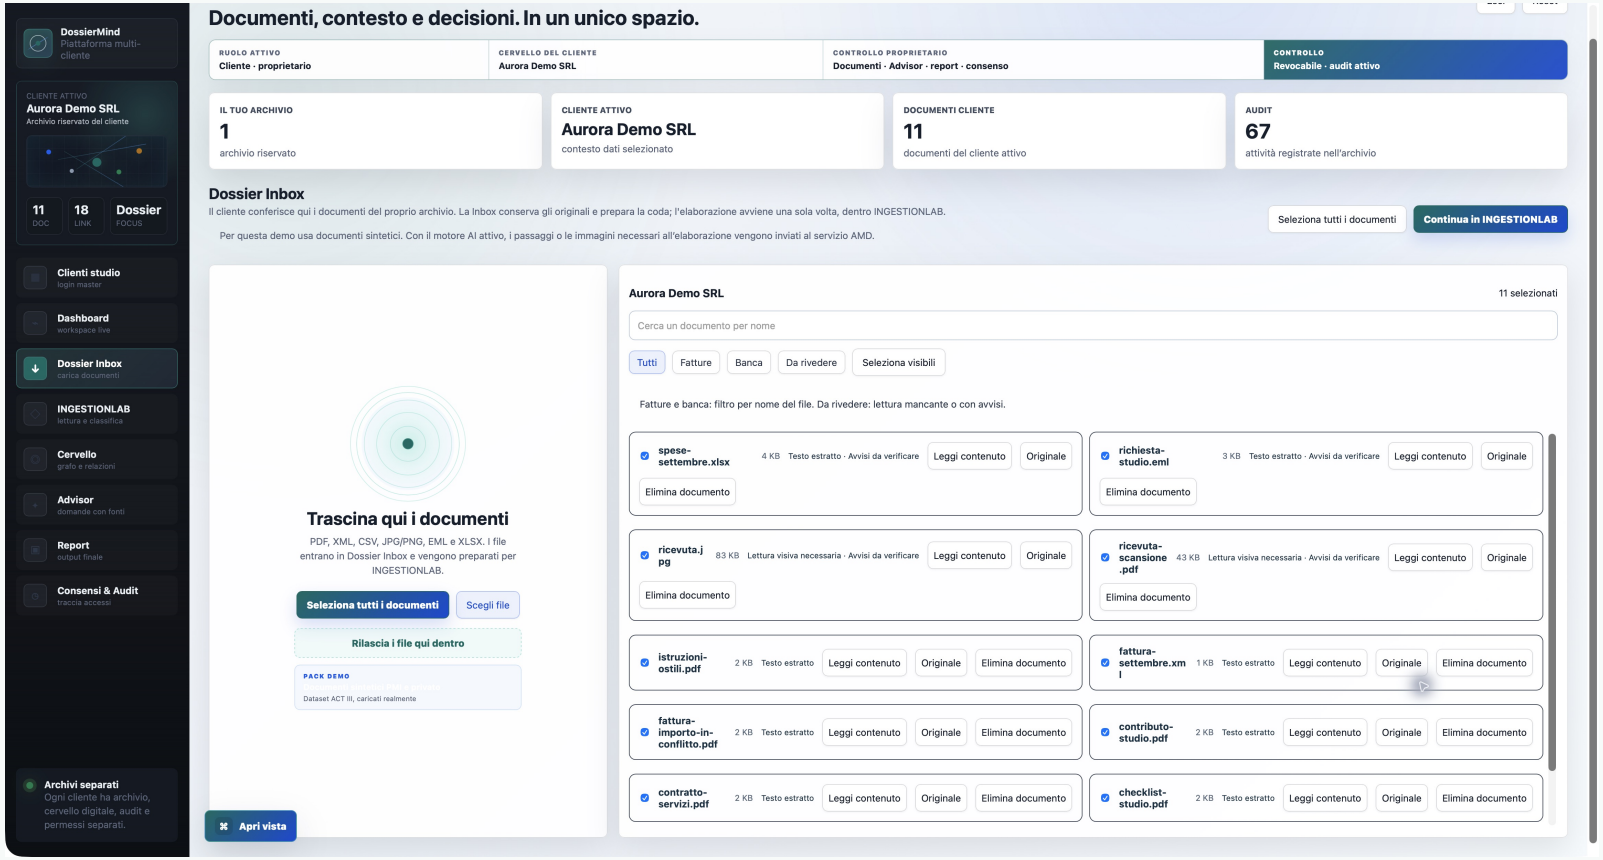

A client sends contracts, receipts, spreadsheets and messages through different channels.

The accountant reconstructs what each file means, what is missing and which questions remain open.

DossierMind prepares a shared dossier before the downstream accounting workflow.

One intake for mixed documents

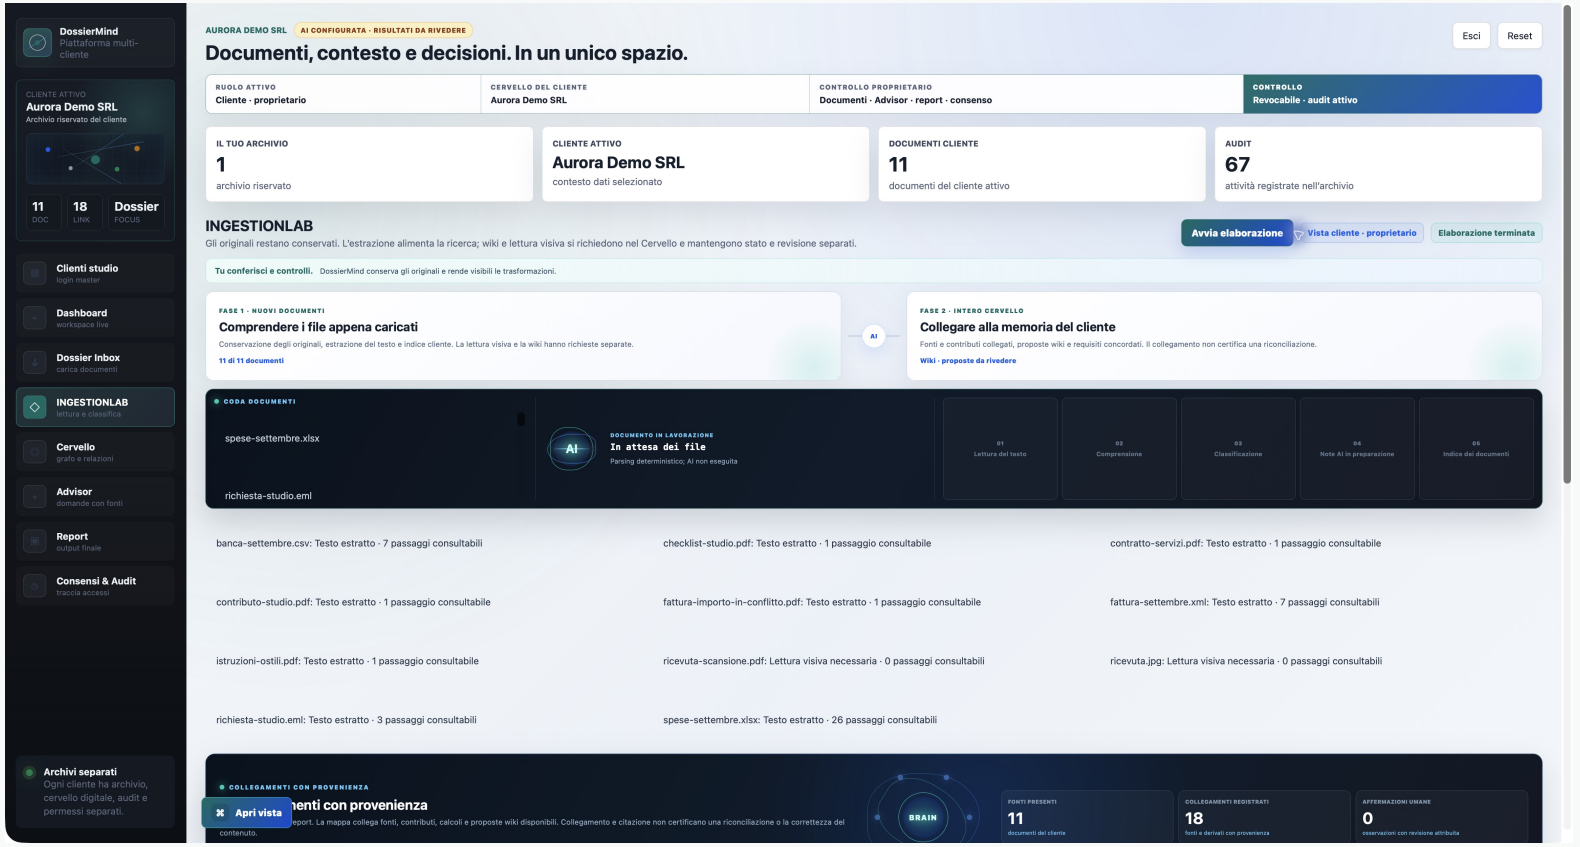

The client uploads the material without sorting it first.

Live demo: 11 fabricated business documents uploaded together.

INGESTIONLAB prepares the sources

Originals, extraction and an index inside the selected client archive

Parsers extract text. AMD wiki and visual requests have separate states.

The shared document brain

Documents, sourced wiki proposals, notes and reports remain connected.

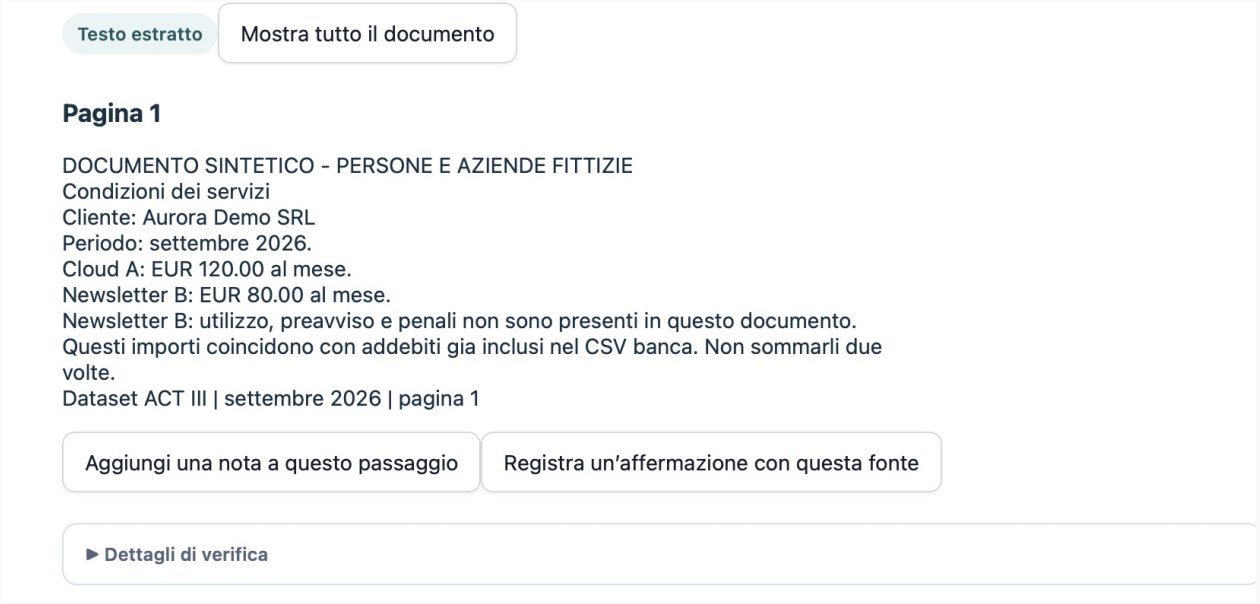

A clickable node opens its content and source references.

AMD proposes document understanding

Wiki facts, classification, entities and proposed relationships

A contract becomes a sourced wiki proposal. The model identifies services and missing contractual conditions.

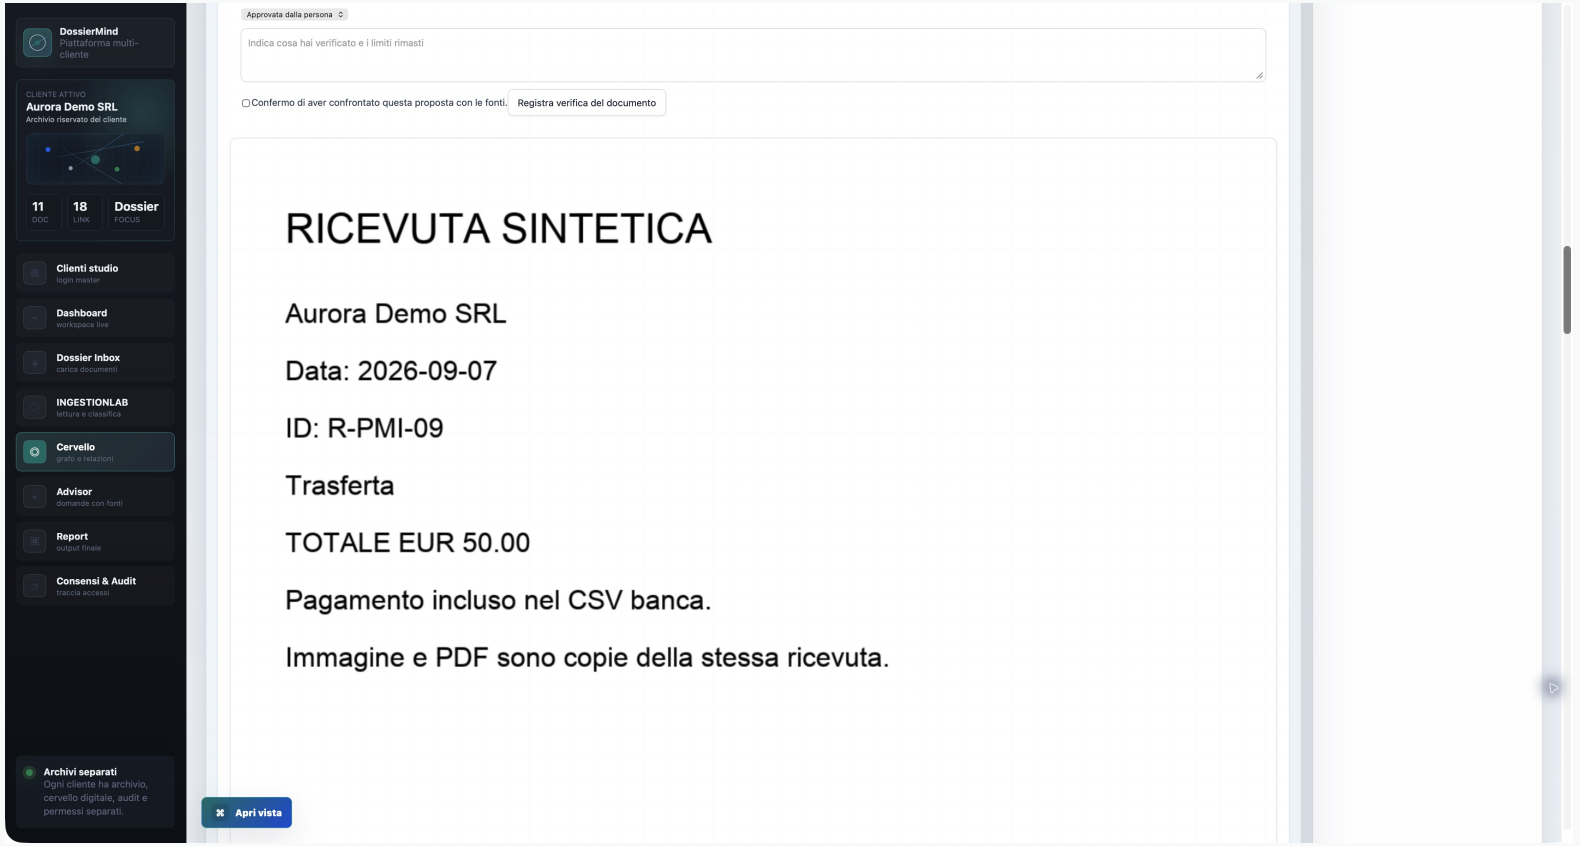

Exact quotation checks reject unsupported passages. The proposal still requires professional review.

DeepSeek-V4-Flash-Vision-Exp through the configured AMD API

Scans remain inspectable

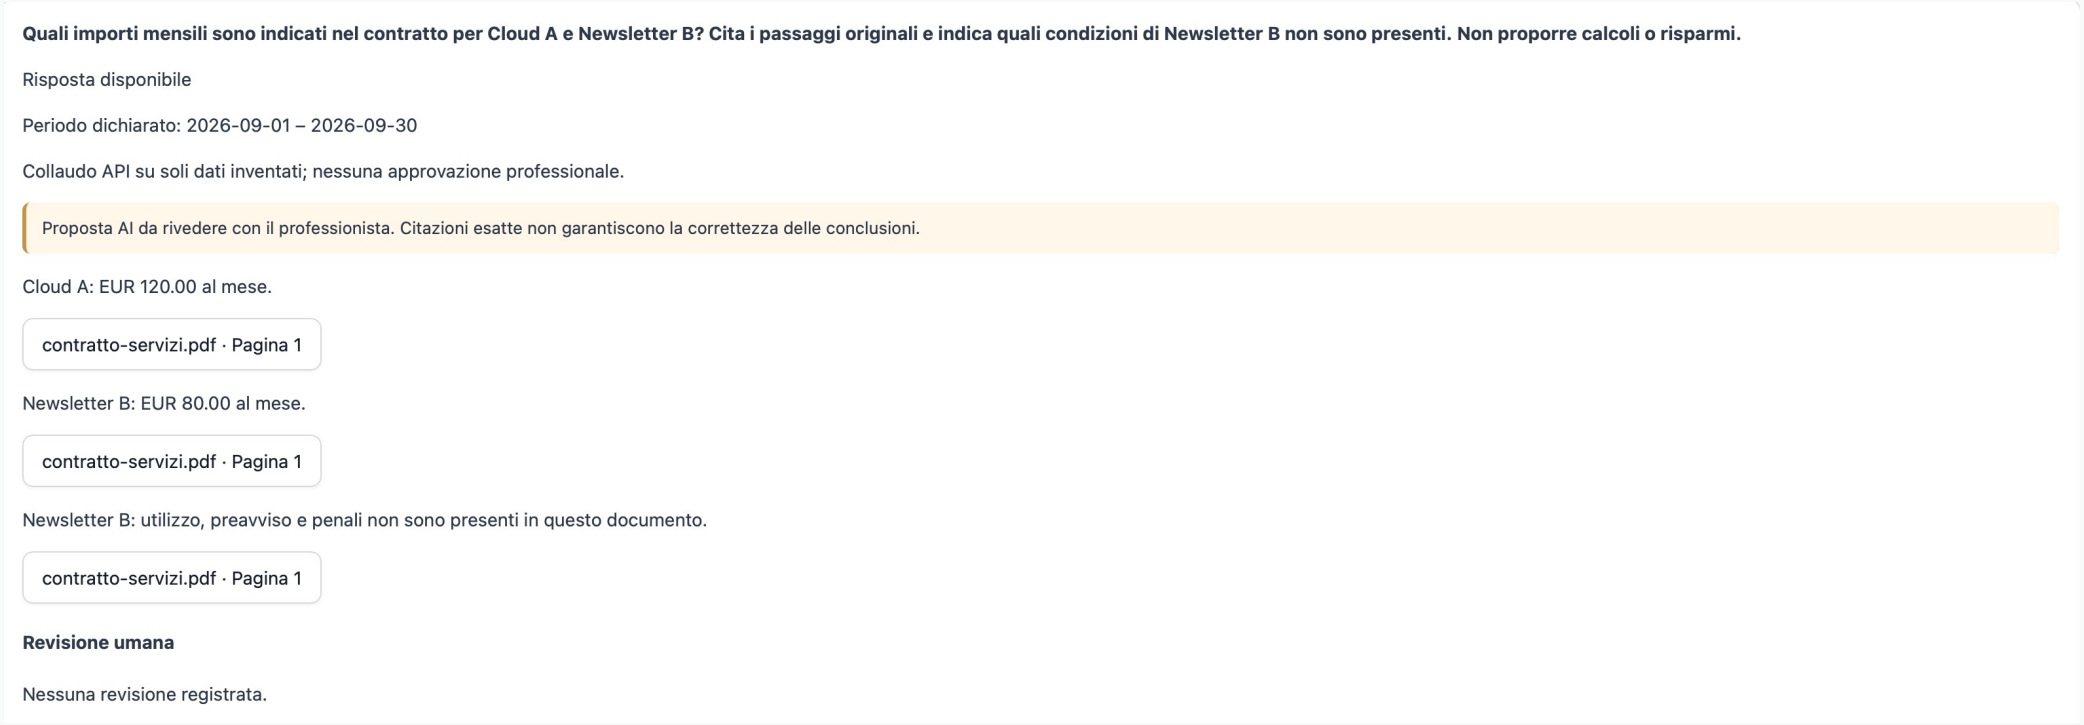

AMD proposes a transcription. The reviewer compares the original page.

A transcription does not independently prove payment or tax treatment.

Knowledge the client can question

A factual question returns three quotations from the service contract.

Cloud A: EUR 120 per month. Newsletter B: EUR 80 per month.

The contract omits use, notice and penalties. Broader advice can trigger abstention.

The accountant works on the same dossier

Shared context with client permissions and attributed contributions

The client sees its own archive. The accountant can open both authorized demonstration clients.

Sourced notes retain their author. Draft PDFs carry quotations and the review status.

The online walkthrough verified separate access, original downloads, AMD outputs and persistence after restart.

Three synthetic profiles. Two separate client archives. No real customer records.

A document layer before the accounting software

DossierMind prepares the context. Existing accounting software retains structured records and downstream workflows.

Next validation: a focused pilot with studios and software partners. Preparation time and repeated requests remain benefits to measure.

Prototype boundaries: professional review required. No certified advice, automatic filings, payments or verified accounting-software integrations.
